

ML engineer with an early independent research project in image-classification uncertainty. Focuses on reproducible datasets and careful evaluation, connecting that research experience with later applied classification work.

Professional Experience

Northstar Transit Labs (fictional) <i>ML Engineer</i>	2022–present
○ Built a monitored document-classification service with human review and reproducible evaluation datasets. ○ Reduced manual triage time by 35% in a fictional internal pilot while preserving reviewer approval. ○ Built an internal retrieval assistant with source citations and an evaluation set. ○ Reproducible datasets Monitored models	
Meridian Analytics (fictional) <i>Data Scientist</i>	2018–2022
○ Used Python and SQL for forecasting, experiment analysis, and dashboards. ○ Coordinated a small cross-functional working group and mentored junior analysts.	
Example University (fictional) <i>Independent research project</i>	2017–2018
Evaluated uncertainty in image classification on a synthetic dataset and shared reproducible notebooks internally. This was not a peer-reviewed publication.	

Core Expertise

Evaluation: Python, PyTorch, image classification, uncertainty evaluation, and model monitoring.
Reproducibility: Synthetic datasets, reproducible internal notebooks, and evaluation datasets.

Relevant Project Evidence

Research Scope: The university project used synthetic image data and internal notebooks; it was independent project work, not a peer-reviewed publication.
Applied Evaluation: Later built reproducible classification datasets and a retrieval evaluation set at Northstar, carrying an evaluation focus into applied ML.

Education & Profile

Example University (fictional) <i>BSc in Computer Science</i> Fictional degree for the public demo.	2017
Profile: Fictional portfolio example
